Street, Cambridge, MA 02139, USA
Approximately 800 bp of telomeric sequence missing from the left
end of the chromosome and 200 bp missing from the right end.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             translation="mmmeavpsarlsstqHvGLCRLCNSPLVHTFvDLGMSPPCESF"

```

```
/Mote="SCSG3.14, hypothetical protein, len: 959 aa;
unknown function, similar to TR.054182 (SMED:ADC1411)
Streptomyces colicolor hypothetical protein (913 aa),
fasta sories; opt: 698 z-score: 776.6 E(): 0, 27.0%
identity in 972 aa overlap. The C-terminus shows very weak
similarity to eukaryotic beta-transducins e.g.
SW:GBB4 MOUSE (EMBL:S86124), gnb4, Mus musculus guanne
inclectide-binding protein beta subunit 4 (340 aa) (23.0%
identity in 291 aa overlap). Contains possible hydrophobic
membrane spanning region"
